## 1. Project Justification

PostBuilder is designed to demonstrate a modern, frontend-driven content creation workflow with structured JSON publishing. The project simulates CMS-style form entry, live previews, validation, and asynchronous submission, providing a portfolio-ready example of full-stack workflow design. This tool showcases skills in frontend state management, structured content modeling, and API-style output generation.

## 2. Project Objectives

- Provide a multi-step form interface for creating blog posts
- Enable real-time content preview and UI feedback
- Generate structured JSON representing the post for API or publishing workflows
- Demonstrate native + custom validation handling
- Include a lightweight backend for processing uploads and JSON generation

## 3. Scope

**In Scope:**

- Multi-section form: Post Details, Author, SEO, Tags, Media, Publish Settings
- Live post preview updating in real time
- Tag input and removal with dynamic UI
- Image upload with client-side preview and validation
- Slug generation and form validation (native + custom validation)
- Asynchronous form submission with JSON generation and success/error handling
- Autosave and draft restoration

**Out of Scope:**

- Persistent database integration (future enhancement)
- Multi-user collaboration features
- Advanced markdown editor

## 4. Deliverables

- Fully functional PostBuilder web application (HTML/CSS/JS frontend + PHP backend)
- Structured JSON output for each post submission
- Live preview panel reflecting all post data
- Documentation: README, architecture diagram, and screenshots

## 5. Assumptions

- Users will interact via modern browsers supporting HTML5, JS, and Form APIs
- File uploads are limited to JPEG/PNG under 2 MB
- Local storage is available for autosave functionality

## 6. Constraints

- Maximum 20 recent posts retained on the server
- Character limits enforced for all input fields
- Project must remain a lightweight portfolio demo, not a production CMS

## 7. Success Criteria

- Users can submit posts via multi-step form and view live preview updates
- JSON output correctly reflects all input, including tags and images
- Validation prevents invalid submissions and provides clear UI feedback
- Autosave restores drafts on page reload
- Project serves as a demonstrable portfolio piece showing frontend workflow and backend integration

## 7. Key Stakeholder

- **Project Sponsor / Author:** Alejandra Badia

- **End Users / Testers:** Portfolio reviewers, hiring managers, technical audience
- **Technical Reviewer:** Frontend & backend developers reviewing code structure
